SEALAND AVIATION LTD. – An Overview

Sealand Aviation Ltd. overhauls, rebuilds and repairs small aircraft, and designs and manufactures aircraft modification kits and components. The company provides excellent maintenance and services on both float and wheel equipped aircraft.

Sealand Aviation was started by Bill Alder in Campbell River, British Columbia, to maintain the commercial floatplanes that service the forestry and fishing industries on the Canadian West Coast. Sealand Aviation quickly established a reputation for reliable and efficient customer service. Although aircraft maintenance and repair is still the mainstay of the company, Sealand Aviation designs, certifies and manufactures modifications, primarily for the deHavilland Beaver, including the Cabin Extension Kit and the Alaska Door. New and innovative products are developed and manufactured in response to customers' needs. Sealand Aviation works with some of North America's best engineers for certification. The customer base is worldwide.

The plans are in place to construct a new 18,000 sq. ft. facility at the Campbell River, B.C. airport in early 2003. This will enable the company to offer the same expertise and innovation to a broader range of aircraft, owners and operators.
